

Various companies are offering apps for tracking infections during the corona pandemic.

With the digital solutions, the contact data of customers, guests or event participants are processed. These procedures must be carried out in accordance with data protection regulations. The conference of the independent data protection supervisory authorities of the federal and state governments (DSK) points this out. In its statement, the DSK names technical aspects that app developers should take into account. It is also calling on the legislature at state and federal level to create uniform nationwide legal regulations for digital contact tracing.

Statement on contact tracing in times of the corona pandemic
